

The background of the slide is a light gray gradient. It is decorated with numerous realistic water droplets of various sizes. Some droplets are large and prominent, while others are small and subtle. They are scattered across the slide, with a higher concentration in the top-left and bottom-right corners. Each droplet has a soft highlight and a subtle shadow, giving it a three-dimensional appearance.

# PADDING

- Padding is used to preserve the dimensions of input image in the feature map
  - The input image before convolution and the feature map after convolution would have the same size
- Types of padding:
  - Same padding
  - Zero padding
- Padding with even-sized kernels
  - Non-symmetric padding needs to be used for even-sized kernels
  - This is one reason why odd-sized kernels are preferred

# MAX POOLING

- Pooling is used to reduce the spatial dimensions, which can help in
  - Reduction in the number of parameters
  - Being less prone to overfitting
- Commonly used pooling types:
  - Max pooling
  - Avg pooling

# MAX POOLING

Feature map  
before pooling

2x2 max pooling:  
The maximum  
value of each 2x2  
block is computed
